December 15, 2019

To the Humu Hiring Team:

My name is Nathan Chan and I am currently a student at UC Davis graduating in June 2020 with a Bachelor's in Statistics with an emphasis in Data Science. I am currently a Data Analyst at both a psychology lab and a human development lab here at the university.

To save you time, I have researched your company and the position so I can highlight the relevant portions of my resume and aspirations.

- As a Data Analyst at two labs, I have worked extensively to clean survey and hormone data from the California Families Project (a decades-long study researching Mexican American families), among other technical tasks like redesigning their website and a brain image processing pipeline. My knowledge in R, Python, and Linux have been helpful to the researchers who don't necessarily have a technical background like I do. I am particularly interested in this application of computing to psychology, which is specifically what Humu is about.

- I have several projects in R, Python, and SQL that demonstrate my proficiency in coding, analytics, and ability to communicate results.

- My personal website, which I coded from scratch, also serves as a testament to my front-end and back-end coding ability.

- As a Research Assistant at another psychology lab, I have experience analyzing data in SPSS that I presented at a research conference. This work is also especially relevant to the company's mission and work of applying computing to social science.

I look forward to a live discussion to further illustrate my fit for this position along with the opportunity to ask you more about the position and your company's direction.

Sincerely,
Nathan Chan
